The choice of area to study water quality is really interesting as this will be an eye opener for different agencies to look the society prevailing there.

Few comments which the authors has to consider seriously are

- a. The typographical errors and language has to be addressed in detail
- b. Non availability of the data, figures, tables makes the reviewing process difficult.
- c. Some of the parameters and its correlation are not explained properly

Though the study gives you an idea of the prevailing scarcity and its pollution in the area chosen, the results were not that convincing, because the authors explain about different samples collected like from source to end use first, later for analysing the heavy metals compare samples in different locations. This confusion is all over the article.

On the whole, the data's are there, but the authors couldn't explain it in a chronological way. If they can explain in an order, this article can be considered.
