

# Review of: "Microbiological analysis of commonly consumed vegetables: A review on the ongoing studies"

Lilia Méndez-Lagunas

Potential competing interests: No potential competing interests to declare.

The manuscript presents an extensive review of the microbiological analysis of commonly consumed vegetables. It is suggested that the authors add a more detailed description of vegetables' most common bacterial and fungi analysis methods. Additionally, include a table of acceptable limits, according to official standards, for bacteria and fungi in food.
