

Review of: "Understanding General Relativity and Gravity Through the Heaven/Earth Framework— A Yijing Perspective"

Potential competing interests: No potential competing interests to declare.

The main contribution of this article is to regard the *Yijing* and the theory of relativity as different approaches to describing the world. The article said that "The *Yijing* uses metaphorical language and symbolic imagery to convey its ideas, while the theory of relativity relies on precise mathematical models and empirical observations. However, both approaches seek to understand the patterns and cycles of the universe and our place within it."

My concern is that the *Yijing* seems to describe the changing characteristics of things on the earth from the macro, on the other hand, the theory of relativity is to propose a model to describe the universe; how these two would have similarities?
