

Review of: "Study of diffused light levels in an institutional common eating area in New Delhi"

Fen Li

Potential competing interests: No potential competing interests to declare.

1. This whole paper structure is too simple, research review accounts for half of the content. The description of conclusion is only two sentences.
2. It is suggested that correlation analysis should be done, including the simulation of physiological indicators, the size and type of different windows, the simulation analysis of sunshine rate, and more acquisition simulation points should be added.
3. The innovation of the research is insufficient, especially the methodology and case study part. The basic situation of case study is missed.

Unfortunately, it is my opinion that the paper does not appear to be a candidate for consideration in this Journal.
