The manuscript aims to be a review of vasculitic complications localized to the eyes during SARS-CoV-2 infection. The review is a little lacking in data and, in the end, only collects 12 cases. However, it is interesting to bring to the scientific community's attention that, among the various vasculitic localizations during COVID-19, there are also ocular localizations. The review would have been much more complete and interesting if the author had completed it by also reporting data on ocular vasculitis linked to mRNA vaccines.
