

Review of: "Necessity Was the Mother of Human Cultural Invention"

Shahrul Anuar Mohd Sah

Potential competing interests: No potential competing interests to declare.

The manuscript delves into the progression of human behavior, emphasizing the restraint of innate instincts and the cultivation of learned behaviors. It explores the pros and cons of both instinctual and learned behaviors, the significance of social species in evolutionary processes, and the influence of cultural evolution on human communities. Additionally, the manuscript scrutinizes instances of inhibited neural pathways, lingering instincts, and behaviors learned compulsively, such as those related to mating and food preparation. It underscores the repercussions of these behaviors on genetic and cultural development, the resolution of conflicts, and the economic rivalry among advancing cultures.

Abstract needed to provide a flow of brief and important introduction, objectives, approaches, and critical results and discussion.
