Potential competing interests: No potential competing interests to declare.

The Authors reported the work in a very systematic order.

1. The authors need to incorporate the importance of their work related to a specific application.
2. The Abstract also needs to be revised; the present form does not show the actual work properly.
3. The clarity of the images is very poor, and in some places, units are not mentioned correctly.
4. Micrographs don't have the micron marker.
5. The authors need to highlight the novelty and practical application of their work and materials.
6. The authors reported some findings, and many of those can be expected without any experimentation.
