The paper is interesting and can be published, but it also needs some changes and new descriptions before acceptance. It must be well described how the pavements are made. The article only indicates the use of sand and plastics, but what binding material is used? This needs a high discussion. Besides, although some results are higher than others, more analysis should be necessary in order to understand or analyze the presence of pores, etc. If it were possible, I recommend analysis by optical and electronic microscopies after fracture.
