**Potential competing interests:** No potential competing interests to declare.

The main objective of this research article is to examine the impact of a management information system (MIS) on the coffee plantation sector in SWER.

However, from the conclusions it is not clear how the impact of MIS is on the coffee plantation sector in SWER.

It was stated that the method of data collection was direct observation of the location and study of secondary data on the subject, but it was unclear what primary data and secondary data were obtained to support the research objectives.

The writing systematics of this article are jumpy, for example, it does not explain why an information system is needed in coffee plantations, but the article directly explains the purpose of the article. This article consists of an introduction followed by a literature review and a direct conclusion. There is no discussion section in this article
