Congratulations to the authors; it is an interesting article from a theoretical point of view about the different factors that affect the longevity of electric vehicles.

1. It would be interesting to add some data that could support the points presented, such as a comparison with different battery technologies to see some of the variables that directly affect the longevity of EVs.
2. It is also important to mention and describe some of the techniques used for EV charging.
3. Minor revisions to the English are suggested.
