Topic of Review: Reducing non-revenue water in Egypt using GIS

–

Merits of Manuscript:

Considering the increasing challenges in drinking water for present and future generations, it is a sensitive topic.

Demerits of Manuscript:

The methodology adopted needs to be more suitable considering the diversity of human behavior and social structure. It can be implemented in local case studies but only as part of a few good, reputed journals. It needs more in-depth study and a scientific approach along with significant data.

The decision of the Reviewer:

This manuscript is not suitable for any journal with current data and information. The author needs to make an honest effort to resolve the issue, which is very genuine worldwide.
