The authors incorporated details in the methods, but in the introduction. I still do not see what the problem to be solved is, and I see a series of background information that, as they are placed, seems merely like ideas. I suggest that the methods include what terminology they based the descriptions on, and I suggest that the observations section be changed to results.

Although the article does not present so much detail, nor does it have a robust method, I suggest that the details I have mentioned and many of the other reviewers' comments be included; that will enrich the publication.
