Congratulations on your work!

I consider that this article should be accepted with some changes described below:

The title, "Biological Components in Cucumbers (Cucumis Sativus L.): Implications for Pickle Manufacturing and Health Benefits in Fresh and Processed Varieties," suggests that there is an exhaustive study on the beneficial effects on health; however, it is limited to describing possible effects without explaining or comparing studies. It would be necessary to introduce clinical or animal studies of the described effects and properties for a better understanding of the impact of cucumbers on health (like antioxidants). It also would be convenient to separate the proven effects from the potential effects that are not yet proven.
