The topics for this article is valuable, but there are still some problems.

1. It is better to state in the abstract what factors are all considered so that readers can have an overall understanding, and then list which factors are found to have the greatest impact after the study, which is more convenient to read.
2. As the author stated, there have been related studies, and much of the paper just uses NDHS 2016 data to verify the findings of previous research, and further in-depth analysis is needed to dig into the causes of specific phenomena.
3. The analysis method is too simple, for example, it can also consider the spatial heterogeneity of the choice of medical care. There should be a clear difference between rural and urban areas, and different cities should also be different.
