Aniridia-absent patella syndrome

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base*. [Aniridia-absent patella syndrome](#). ORPHA:1069

Aniridia-absent patella is a syndrome described in three members of a family (a boy, his father, and his paternal grandmother) that is characterized by the association of aniridia with patella aplasia or hypoplasia (see these terms). The grandmother also had bilateral cataracts and glaucoma. There have been no further descriptions in the literature since 1975.
