Dear Author:

I consider that this study provides an interesting revision regarding studies about drawdown zones in African freshwater reservoirs.

The title adequately reflects the subject of the manuscript.

The summary gives all necessary information about the background, results, and conclusions of the study.

Tables and figures are intelligible. The definition of line draws in figure 3 may be improved.

Conclusions are based on the results, and the manuscript includes up-to-date references.

The manuscript needs some editing and language improvement. I have suggested some corrections in the PDF file uploaded in supplementary data. I have corrected grammar and language, in general, but I suggest making a serious revision of English before sending a revised version.

Revise that all the articles cited are in the references list.

I hope my comments and corrections help to improve this manuscript.
