This paper is interesting and presents perceptive points about the effectiveness of pelvic floor exercises on erectile dysfunction. I present some aspects that are important for the detailed review. For example:

1. The title is very long. My suggestion is: "EVALUATION OF THE EFFECTIVENESS OF PELVIC FLOOR EXERCISES ON ERECTILE DYSFUNCTION IN PATIENTS SURVIVING RECTAL CANCER."
2. What is the problem statement? What is the scientific gap?
3. In the results, it is important to present graphical representations and p-values for all variables of the result. You should make the statistical analysis for all variables.
4. In the conclusion, you need to highlight the findings that were the objective of the study.

Congratulations on your interest in researching such an important topic.
