Potential competing interests: No potential competing interests to declare.

This article aims to give an approach to how education systems can answer the needs of economic dynamics, industry, and globalization.

I suggest strengthening the introduction with real phenomena about sample conditions of education systems that should be developed well, so this research will give answers and empirical results to the problem. It's good to give key points of contribution.

Enrich the literature with updated references, especially during the pandemic and post-pandemic, because we all agree that the technology used during the pandemic was massive. I think this situation brings new innovations and development to education systems.

How to measure whether education can bring a huge impact on the economy? We can conduct a survey or observation of alumni of the institutions who have strategic positions in their careers or are impactful to society with their professions.

Focus group discussions can be conducted to generate ideas and advice from industry, professional associations, higher academic institutions, academic experts, so the schools can improve their curricula related to the discussion. So, the curriculum/learning methods can answer global/industry/society needs and can have an effect on the economic condition.

Good luck and keep up the good work. Thank you.
