Potential competing interests: No potential competing interests to declare.

1. The methods section is confused and disordered. The author should list clear methods for using PCA and KMO. It seems that they are used to find proper cities for tourists, but there is no standard. That means the author failed to illustrate the reason, the process, and the specific models of the methods. It is necessary to list the reason, the process, and the specific models of the methods.
2. The results in the figures have no original data. Please add the original data.
3. The route result in Figure 3 is weird, since there is no original data. The route looks like a route for a plane trip. Such simple two lines—whether the route algorithm is necessary or not? Such a simple route, a tourist can randomly plan by himself without an algorithm.
4. The experiment has no persuasiveness.
