

Review of: "Numerical Study of Thermal Performance on Fin and Tube Heat Exchanger with Flat Rectangular and Sinusoidal Winglet Vortex Generators"

Yung-Lan Yeh

Potential competing interests: No potential competing interests to declare.

1. More experimental results should be addressed in the abstract.
2. The keywords are not proper. They are too long.
3. In the introduction, the motivation is not obvious and should be enhanced.
4. The boundary conditions are not well defined. The reader cannot know their rationality.
5. The steady state should be one of the assumptions.
6. The used figuration must be explained in detail.
7. A comprehensive conclusion combining velocity and pressure should appear to further explain simulation results.
8. All the contents are not enough to constitute a journal paper.
9. The conclusions are straightforward results without physical explanation.
10. There are also many bad writings, such as in this present work.
