In the insightful review, "The Imperative of a Comprehensive One Health Approach for Mosquito-Borne Disease Control in Indonesia," the author adeptly underscores the critical need for an integrated One Health strategy to tackle the persistent and complex challenge of mosquito-borne diseases in Indonesia. The work illuminates the interconnectedness of human, animal, and environmental health and advocates for a multidisciplinary collaboration that includes strengthening vector surveillance and control, enhancing human health and behavioral capacities, fostering effective communication across sectors, and bolstering infrastructure and resources. This comprehensive review not only highlights the importance of a holistic approach to disease control but also serves as a clarion call for policymakers, public health officials, and the community at large to adopt proactive measures that align with the One Health paradigm. The author's contribution is a commendable effort that provides a foundational blueprint for advancing towards a mosquito-borne disease-free Indonesia, emphasizing the need for immediate action and strategic planning to safeguard public health.

However, there are some suggestions that may increase the quality of the paper or even future works in this context:

1. **Methodological Detailing:** Include a more detailed description of the methodology used for the literature review, such as databases searched, keywords, selection criteria for studies included, and the period covered. This would improve the reproducibility and credibility of the review.
2. **Case Studies and Examples:** Incorporate specific case studies or examples of successful One Health implementations, either within Indonesia or from other countries with similar contexts. This practical insight could provide valuable lessons and models for adaptation.
3. **Quantitative Data and Analysis:** If available, integrating quantitative data on the impact of mosquito-borne diseases in Indonesia and the effectiveness of existing control measures could provide a stronger evidence base for the recommendations.
