The work is noteworthy and significant. The paper can be improved if the following problems have been addressed. This article discusses the importance of identifying spatial clusters that might help us pinpoint the genesis of an epidemic. While the goal of this notion is significant and intriguing, the essay fails to elaborate on how it is actually accomplished. The research appears to make no significant advances to either public health or geographical information systems (GIS). Furthermore, the lack of modeling and empirical data is a significant constraint.
