Review of: "Factors contributing to labour unrest at the garment factories in Bangladesh: A cross-sectional study"

Nasri Harb

Under Sample Estimation of the study, what is the proportion of the study (p)? i.e. proportion of what?

It is unclear what is (are) the dependent variable()s.

Figure 1 is unclear. How does it relate to the text?

Since the article is about the factors contributing to unrest, I strongly suggest that the dummy variables in the regression to be as follows: (=0 if not agree, =1 if agree). This will focus more on the factors that lead to a positive impact on the unrest.
