Potential competing interests: No potential competing interests to declare.

In general, this paper is good because mastitis is still a quite complicated problem in the agricultural sector, especially in dairy cows, especially in developing countries.

There are several minor revisions or clarifications that need to be addressed in this paper:

1. In the title, *Staphylococcus aureus* should be written in italics.
2. The references used should be a maximum of the last 10 years; in this paper, there are several journals that are old (2001).
3. A basic question: why use CMT in this study? There is no emphasis yet in the Introduction.
