The work is quite interesting; I have a few suggestions to be incorporated:

1. There are lots of typing and grammatical errors. Correct them throughout the manuscript.
2. The units of the data are not following uniformity; at some places, MKS is used, and at others, CGS.
3. Provide the key results in the abstract and also make it concise.
4. The results need to be well supported with the literature.
5. Explain how this process is superior compared to other existing processes.
