Potential competing interests: No potential competing interests to declare.

The article provides comprehensive information about Turkish agriculture. The negative effects of climate change in text and the measures to be taken against these negative effects are explained.

However, the article does not have the characteristics of a scientific article ready for publication. Structurally, the article does not contain sections such as findings and conclusions. It does not contain enough current literature. There is no critical discussion section in the article. The article is very long and contains unnecessary repetitions in many places. Abbreviations are not explained in some places (such as NDC). Chemical formulas are not read accurately. (such as CH₄). Figures and tables have not been numbered properly. Cite is made to the numbered sections in the text although the section headings are not numbered in the article.

In some places, numbering is used, in some places bullet points are used. The text resembles a report consisting of a list of bullet points rather than a scientific article. Not cited in some places. Ethics control should be done with a plagiarism program such as Turnitin.
