E-cigarette

Robert West¹

¹ University College London, University of London

An electronic hand-held vaping device that produces for inhalation by a person an aerosol formed by heating a liquid, called an e-liquid. The e-liquid contains one or more humectants (propylene glycol, glycerol or glycerin), usually together with flavourants and nicotine. The heating is achieved by means of a battery-powered heating element that is activated by a switch or by suction as the user sucks on the mouthpiece of the device.
