Potential competing interests: No potential competing interests to declare.

I have read the article, an important concept that need to be explored. However, I need to emphasize here that in the Introduction, there is a need to elaborate the methods through which the AMU help in reducing mortality rate, length of stay (LOS), patient and staff satisfaction and readmission rates. I do understand that this is a preprint but some lines can be replaced with this important information along with references.

In the result section, there is need to include the control group so the difference in the above indicators can be compared. Without a control group, we can't conclude that the establishment of Acute Medical Units has helped to decrease the Length of Stay of admissions. My suggestions is to add a control group to the study and also if possible you can look into the factors responsible in reducing the LOS. Number of episodes need to defined as well.
