Potential competing interests: No potential competing interests to declare.

This paper shows that CH is equivalent to a choice principle.

Thats great!

The paper then claims that this is a reason to think CH is true.

Thats debatable!

However, the approach is interesting.

An approach to CH that is similar in spirit is

Freiling's axiom of symmetry which is used to show that

CH is true.

Proposition 4 of the authors paper seems to be stated incorrectly.

Just take f to be the constant function that always outputs x

would work. I think the author wants to put some condition on f .
