The work is very interesting, and his writing is attractive. The result of the survey is specific to the Syrian people, but it can be generalized among populations who have the same customs. The English used is academic, and the structure of the article is very clear. The questions asked by this survey are well targeted. For the processing of the collected results, specific software must be designed to clearly clarify the benefits of the consumption of Yerba; unfortunately, the authors have contented themselves with standard SPSS. In the discussion, I would have liked to see the comparison between the results reported by this study and other research in the same context.

I give a favorable opinion for the publication of this article, and I could not resist reading it as soon as I got it. It can be considered a bibliographical collection on the traditions of the Syrian people and the interest they give to this plant.
