Potential competing interests: No potential competing interests to declare.

- The article presents an extremely interesting topic and it poses a true concern on how quality evaluation of children's toys is still lacking in some areas;
- Methods section: statistical descriptive in terms of age, gender and occupation of the 14 experts could be provided; a detailed but concise description of how the constructs were found in literature and how eventually a list to be judged was created;
A brief description of the interpretation criteria of the AHP would be useful to people who do not belong to this field/have never used this method to better understand the results obtained through this study;
- Conclusions: they are quite short, I suggest authors to make a brief summary of the results section and to add possible limitations, potential impact and future perspectives of their study;
