Potential competing interests: No potential competing interests to declare.

The work is just a report of some measurements, but it is not structured as a scientific or academic document. The authors must review some papers and publication guides to accomplish the minima contents of an article.

From the manuscript it seems that the study were not made meeting the standards about measurement equipment and conditions, hence it would be difficult to be in conditions of being published.

Notwithstanding the foregoing, I would like to encourage authors to take this as an essay of future research in this relevant topic, because vegetation is not only a natural noise barrier (more or less effective) but an important way to mitigate high temperatures and air pollution in cities, and it is helpful in doing more friendly urban sites.
