

# Review of: "Assessment of soil erosion in the Cesar watershed, an initial step toward the restoration of the Cesar River"

Arturo Godínez-Tamay

Potential competing interests: No potential competing interests to declare.

I do not have many suggestions, only these ones:

- In your keywords you must emphasize that you are analyzing soil erosion.
- The meaning of "RUSLE-GIS-GLUE-SDR" should be explained from the beginning.
- The basin contour in Figure 1A can have a light color for not to be confused with other lines.
- Maybe a shadow map under the figures 1B and 1C could enhance the representation. The same recommendation for the other maps.
- The number of the equations must be indicated.
- It must be explained whether the DEM had a treatment to remove uncertainties that affect the analysis.
- It must be mentioned whether the tool corresponding to Qgis LS-TOOL tool has been used in previous research to know its validity.
