Potential competing interests: No potential competing interests to declare.

Dear author,

Writing a case report can be done for a variety of reasons, including assessing treatment outcomes and enhancing problem-based medical education. Case reports often give an individual patient's clinical course, report of results, and prognosis. The patient in the author's case study reported improved functionality as a result of incorporating spine exercises.

The fundamental flaw in this manuscript is that it lacks or omits key information needed to understand the case. To begin with, the introduction does not provide the necessary context for the purpose of the study. The introduction must be pertinent and theoretically grounded. For readers to understand the current study's rationale and procedures, sufficient information regarding the results of earlier studies must be provided.

The author provides the patient's history, but has not included the findings of the clinical examination. According to the author, the patient exhibits phantom pain and a low Berg balance score. After rehabilitation, no presentation of the objective result has been made. Additionally, it is unclear how the clinical hypothesis underlying rehabilitation is communicated. For instance, it is not made obvious how difficulty walking is related to manual manipulation of adduction and abduction to the scapula. It would be difficult to determine whether the rehabilitation offered is new or standard unless the readers are given a description of baseline clinical findings and dosages of clinical interventions given. Because modifications to the case description are anticipated, the discussion section has to be revised. In the current format, it is unclear what the paper contributes to the existing academic literature. *The paper needs rewriting and thorough language editing.*

*I appreciate* the time and effort that you put into the preparation of the manuscript and contributing to the scientific literature.

With best regards,

G. S. Ganesh
