SARS: a human débacle

Comment on a candidate paper (COVID: a human débacle , Saja Sarath , Kumar Boddu) to publication in Qeios, now reviewed by Giovanni C Actis

REFEREE's COMMENTS

I imagine that the Authors meant to conduct a plain review regarding the bulk of the remedies (mostly centered over the antiCovid vaccine option) which became operative at the beginning of January - February 2021. The Authors deem that after some 3 years of real-life practice, it was fully justified to assume that Expert Commissions had accumulated the relevant paper-work in such a way as to fit the needs. (1)

Right from the beginning, the title itself may raise some wonder. The Authors seem to allude to generally deceptive data, deserving the classification of "human débacle", supposed to mean (in its initial French language), a kind of "Total failure", specifically evaluated from a human point of view. However, though re-reading the text twice, my attention was not called by any dramatic draw-back.. As I try to explain below, this manuscript is conveying a far-from-optimal message, yet I do retain that the word "débacle" sounds like an undesirable exaggeration. To approach and interpret what I suppose to make the Author's main message, I guess that a feasible "docking" maneuver might be desirable to reconcile contents and criticisms, and reinstitute a balanced evaluation; on the other hand, unbiased opinions on fastidious topics like the treatment and prevention of COVID-related disorders have to be realistically regarded as being out of reach. Otherwise, the drifts at play in the COVID arena are obvious, and should remain easy-to-treat if Authors and Referees prove to be honest and auto-critical. Firstly, an audit of what the majority of us know as the Corona's effects, separated in the "acute" and "chronic" chapters.(2), would partly do the job.

The Coronas Viral Agents might be felt as the well-identified cause of the well-known pictures of acute inflammatory destruction of the lung alveolar wealth, leading to fulminant breathing failure: relevant pathology may typically include ground glass-like alveolar changes, and the clinical/lab data do characteristically remind of an unchecked inflammatory recruitment: the Cytokine Storm (3-4). The "chronic counterpart of all this, does often appear as an indolent and slow homing of variegated inflammatory cells, at various organ levels: indolent cell infiltrations that might reflect the variable clinics of such disparate districts as: the CNS (appalling still unclear spies of polymorphic CNS degenerations), diffuse ubiquitous colonization. In the mind of many, "Long Covid" has become popular (5) (in the shortage of any better

description).

To make a long story short, we believe that many among the Covid pounding mobs will at least share with us (please excuse the inappropriate use of “colloquial English”) the opinion that we all needed Covid to come and stay with us, more or less than we needed a hole in our heads. Despite winning many combats, we agree with many *that we are likely to somewhat lose the war, perhaps in a fashion still out of sight*. Such difficulties, however, should not convince anyone to step back and forget it all. In dull moments, admitting that it was just a *déba*cle will not help at all.

If nothing better, this will bring a smart chance to mature a sharper eye -sight: In many other fields yet unrelated to gastroenterology, physicians and scientists have come closer to each other to reinforce the healthy memo that reality is better understood and perhaps controlled as a whole, not as a casual gathering of dispersed entities. In a final word, we implemented the basic guess that, like generic inflammatory manifestations, the inflammatory circuits growing around the COVID fire nucleus, are keen at instructing closed inflammatory circles sharing genetic/epigenetic “signatures”, ready to feed altered inflammation pathways in one sense, and to modify a few foundations, in the opposite sense. A concrete logical process here, must not be analytical in nature, but rather holistic /intuitive, and concrete for any other ending.(6)

The message will stubbornly deepen in people’s brains that the same “caring violence” will be needed to help personalize and make the most of translational sciences, whether overtly clinical, or basically biologic.

Also, placing an assertive top on a few conclusively relevant endings should definitively help dissolve the “haze” that initially in our own hands and those of others have attempted coming close to the correct target.

Last, but not least, it should be borne in mind that active people’s participation has shown consistent results in the control of CORONAS viral disease spectrum.

In a poor but potentially persuasive synthesis, we believe that scrutiny over

The COVID story is now showing:

A badly awaited authoritative word on the termination of the “Pandemics” weighing on our shoulders since the last weeks of 2019.

Which “Entity” did really count: 1) The SARS-Cov2-19; 2) The inactivation of the supposed barrier between the Men and Human spaces; 3) An untoward “accident” excessively reducing the World filter function); 4) A casual or purportedly wanted growth of resistant bugs; 5. (Genetic variability amongst bacterial sub groups,) 6. Finally, mutated killers) trespassing the “Glitch in our defense net-work) succede walking free and killing sero-negative random victims.

A finally gentle (yet, perhaps unwanted)) advice to the Authors. Obvious to any one, we are tiredly dragging on a long – winding road. Just difficult times may remind all of the opportunity to back up by one step, handing free road to those whose competence best fits the needs of others who are really being threatened right now. Dropping the metaphora, we simply aim to mean that a commended but routine paper like the review now in my hands, should be righteously held

back until other -wise required on the next occasion.

As of today, the Authors shall under stand that naming a new paper “ A human débacle”) alluding to the bulk of Coronas research as accumulated in three years, will fail pleasing any-one, neither the Authors themselves.
