

Review of: "Biodiversity, Anthropogenic"

Jamal Barafi

Potential competing interests: No potential competing interests to declare.

The study is distinguished in that it addressed the issue of biological diversity from another point of view, as it showed the role of humans and ancient groups in preserving biological diversity over the years, and the researcher was successful in this regard. It is considered one of the few studies that defended the actions and achievements of humans in preserving the environment as a whole. One of the main objectives of the study is to gain recognition of the process of domestication of wild plants and animals in the course of human civilization. However, the study lacks some realistic examples, as we did not find examples of the domestication of animals in compliance with religious duties, as the author wrote. It is also essential to work on clarifying the results and developing specific recommendations that can be applied in the future>
