

Review of: "Network Neuroscience and Translational Medicine: A Case for Abandoning Case Controlled Studies of Posttraumatic Stress Disorder"

Felippe Toledo

Potential competing interests: No potential competing interests to declare.

The paradigm shift, from localized GM changes to WM changes in brain networks to understand health conditions is a complex and still developing field. This paper summarizes extremely relevant biomarkers of PTSD, in addition to providing sufficient methodological reasoning for future research.

The approach of categorizing networks isn't one I personally find especially constructive, as research describing and understanding said networks is still in development. Still, the paper is comprehensive and practical in its analysis, and provides a well thought point of view supported by existing evidence.
