Potential competing interests: No potential competing interests to declare.

It is an article of great relevance for the present day and that brings provocations regarding technological evolution and the current profile of professionals who are being trained for the job market.

I emphasize that the authors bring an important contextualization to understand what technological unemployment would be and its relation to the present day. This contextualization inserts the reader into the theme and brings a criticality to the points under discussion. However, I suggest, already in the introduction, to bring counterpoints on the object of study "academic training and the labor market from the perspective of new technologies.

Perhaps it will only clarify the problem of the study in this initial context. In addition, the discussions afterwards are pertinent and clearly and objectively bring arguments that justify the need to review curricula, and indicating that it is a global reality and not just Nigeria.
