Potential competing interests: No potential competing interests to declare.

I reviewed the manuscript entitled “A VAR Framework of Exchange Rates, Interest Rates, and Inflation Through COVID-19 in Turkey: Empirical Evidence From Linear Cointegration and Causality Analysis” and my comments are as follows:

The author organized the study properly, but I think the discussion and development of the study regarding Turkey are poor. For example, the theoretical background was explained in the Introduction, but it would be better if the author gave more explanation about Turkey.

The literature review section should be updated with more recent studies.

After equation 1, I think there is a problem: “the sigma Δ indicating that the operator is at the first difference”. The name of Δ is Delta, not sigma.

The empirical results section needs a strong discussion and interpretation of results about Turkey.

Policy implications and recommendations should be developed.

The study limitations and suggestions for future studies should be provided.

There are many grammatical errors in the manuscript, and proofreading is essential.
