**Potential competing interests:** No potential competing interests to declare.

This is an interesting article about the possible association between Covid-19 and Alzheimer's disease, and refers to some area of genetic and etiologic relations of both diseases. However, I will point out some matters that can probably help improve it.

1. In the third paragraph: **"With the arrival of the COVID-19 pandemic, already in its fourth year of evolution, chronic-degenerative disorders have begun to be seen, chronic neurodegenerative diseases resulting from Covid-19"** are mentioned. Although the covid-19 causes many symptoms and signs in different body systems, it is still a bit early to use the term "chronic degenerative" because more time is needed for this diagnosis specially to use the term degenerative.
2. The said neuropsychiatric symptoms have been seen in many patients after covid-19 infection; however, their degenerative nature is still questionable and requires more time.
3. It is better to explain why LOAD and Lewy bodies dementia are more likely to be related to covid-19 with anosmia.
4. What is the full term of LOAD?

However, I would like to say that the above article is very well written, scientific and documented.
