Mutation-Negative Lynch Syndrome

National Cancer Institute

Source

National Cancer Institute. *Mutation-Negative Lynch Syndrome*. NCI Thesaurus. Code C150716.

A finding of Lynch syndrome in which one is identified as having a "non-sporadic" DNA mismatch repair (MMR) deficient premalignant lesion or "non-sporadic" MMR deficient malignant tumor, but germline MMR genetic testing did not demonstrate a recognized pathogenic mutation in the genes responsible for DNA mismatch repair.
