

Review of: "Financial Repercussions of Carbon Emissions and Depletion of Natural Resources: The Role of Fiscal Policy in Determining Health Expenditures"

Zheng Zhang

Potential competing interests: No potential competing interests to declare.

This paper examines the impacts of various environmental factors on public and private health expenditures, which has practicality. Also, I have some suggestions for how to make this article even better.

1. The background section is too lengthy. Some of the tables in this section can be displayed as attachments and do not need to be in the body of the text.
2. Some sections can be further graded. For example, section 3 can be subdivided into "3.1 Methods" and "3.2 Data".
3. The title of each section could be revised again with the aim of being more accurate and concise.
4. The same is true for the content. The information that has been introduced in the text does not need to be presented in a table anymore. If information is presented using a table, then the text needs to be more concise. For example, Table 5.
5. A discussion section is missing. Including but not limited to: analysis of the empirical results and their policy implications in terms of their reality, analysis of the impact mechanisms, and comparison with the results or views of previous studies
6. Section 3 contains "The study investigates the impacts of environmental variables through two parts", but the next section does not reflect these 2 parts.
7. The topic is about fiscal policy, but at the end of the summary there are issues about "political stability and absence of violence" that seem unrelated to fiscal policy.
