Review of: "Assessing acceptance of augmented reality in nursing education"

Jae Woo Oh[1]

1 Konyang University

1. It is considered to be a study that suggests alternatives to solve the limitations of clinical practice in the context of the COVID-19 infectious disease.

2. The introduction of AR methods that can be used with v-sim, which has been widely used recently, is thought to have important significance in terms of important nursing education.

3. In the case of the theory used in the study, it is thought that it was used appropriately to identify and improve the learning intention of the learner in a situation where classes had to be conducted in a non-face-to-face situation due to the corona infection.

4. Despite the fact that it is an experimental study, it is considered a reliable research result because of the large number of participants.

but

In the discussion, it is thought that more evidence to justify the researcher's meaningful research results is needed, and the researcher's opinions according to the research results should be clearly presented.

In the case of conclusion, it is necessary to present specific opinions rather than comprehensive contents.
