It would be interesting to test the possible preventive role of any cancer drugs or other likely influential variables on the association between Denosumab and ONJ occurrence. The limited sample size of osteoporotic patients with ONJ does not allow to robustly infer results at this stage; however, considering this study is monocentric and limited to 2 years of observation, a multicentric study with a larger time of observation should offer an interesting framework to test the interplay of multiple factors and a more robust event history analysis.
