The author did a good job of writing this paper about "Revitalizing Key Conditions and Integrated Watershed Management Approach to Sustain Water Availability and Agriculture in Semi-Arid Regions"

As an original paper, one should be disappointed because there is no particular case study; but viewed as a review, the author really presents and discusses some key factors to strengthen the IWSM concept in semi-arid regions.

However, the text is quite long, with a lot of repetitions like in section 4.2.4. The author is encouraged to reduce the length of the document by removing unnecessary passages.

Also, readers should like to see a practical case of the consequences of the misuse of the IWSM approach in an ecosystem and a success story where implementing the conditions you are proposing has significantly increased ecosystem services.
