# Focal palmoplantar and gingival keratoderma

INSERM

## Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Focal palmoplantar and gingival keratoderma. ORPHA:2200*

Focal palmoplantar and gingival keratoderma is a very rare form of focal palmoplantar keratoderma characterized by painful circumscribed hyperkeratotic lesions on weight-bearing areas of soles, moderate focal hyperkeratosis of palmar pressure-related areas and an asymptomatic leukokeratosis confined to labial- and lingual- attached gingiva. Additional occasional features may include hyperhidrosis, follicular keratosis and extended oral mucosa involvement.
