**Potential competing interests:** No potential competing interests to declare.

The article is talk about Sentiment Analysis (SA), one of the popular fields in Natural Language Processing, which analyses people's feelings or opinions about products, services, or anything. Some instances of SA application have been mentioned in the article.

The article is in a structured format and used simple grammar, so that easy to understand especially for beginners. It is completed with a visualization of various social media used for SA.

My suggestion, however, it can be perfect if completed with a study about a lexicon-based approach besides a machine learning approach. Because both approaches have been mentioned in the Abstract. Overall, this article contains basic knowledge of SA and is recommended for beginner NLP researchers.
