

Review of: "Multi-target effects of flavonoids as PPARG agonists in TCGA cancers"

Hezhong Jiang

Potential competing interests: No potential competing interests to declare.

This manuscript analyzes the clinical data of cancers, and emphasizes the influence of PPARG (peroxisome proliferator-activated receptors gamma) on cancer, which lays a certain foundation for future researchers to treat cancer with flavonoids as PPARG agonists, and has certain clinical significance. The manuscript

In mine opinion, this manuscript is well written and could be accepted with minor revision. Specific comments/questions are as follows:

(1) Please pay attention to the citation format of references in the main text, for example: [13], [14], [15] which should be written as [13-15].

(2) In molecular docking, why did the author choose these five flavonoid chemicals? It should be properly explained in the manuscript.
