Autosomal dominant focal non-epidermolytic palmoplantar keratoderma with plantar blistering

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Autosomal dominant focal non-epidermolytic palmoplantar keratoderma with plantar blistering.* ORPHA:402003

A rare, genetic, isolated, focal palmoplantar keratoderma disease characterized by focal thickening of the skin of the soles, and often of the palms, associated with minimal or no nail involvement. Patients frequently present non-epidermolytic painful plantar blistering and, occasionally, subtle oral leukokeratosis or plantar hyperhidrosis.
