

Review of: "Airbase Compatibility with Spatial Planning: A Case Study of Airbase Waterkloof (South Africa)"

Belkacem Lahmar

Potential competing interests: No potential competing interests to declare.

The paper addresses a very important topic that is closely related to the environment. First, the military forces, defence, and armies was the main component of ancient Civilisations, and still in our new world, in another way, from an urban and geographic point of view, military defence or security could considered among urban/land use services, especially related military function, that affect s in economy like, weapon and armours productions, research financing, civilian technology contributions...etc, so, its basically a " standpoint of economic growth". However, some side effects could happen (like any other land use or urban unity), which could be reduced and controlled to an acceptable level

However, the article does not conform to the standard procedure for presenting academic articles in journals. I suggest rewriting your paper with a more committed strict scientific paper, using the IMRAD method, also, the paper has suffered from methodological issues, for example, there are no measurements of noise, Although the paper mentioned the noise measurement from another author, in addition, the impact of noise in urban environment is not clear.

spatial planning or spatial measuring is not well described in the paper, on the other hand, the juridical/historical aspect is good enough, which is considered a literature review.

The abstract should be revised to cover a brief background of the research problem, research objective, methodology, research findings and conclusion.
